# Introduction to the Witchcraft Compiler Collection

Jonathan Brossard
@endrazine

TL ; DR

The Witchcraft Compiler Collection is free
software (MIT/BSD License).

https://github.com/endrazine/wcc

You can write in Lua, Punk-C or C.
No assembly skills required.

Who Am I ?

Bypassing pre-boot authentication passwords by instrumenting the BIOS keyboard buffer (practical low level attacks against x86 pre-boot authentication software)

Jonathan Brossard - jonathan@ivizindia.com

Iviz Technosolutions Pvt. Ltd. , Kolkata, India

"The walls between art and engineering exist only in our minds." – Theo Jansen

Abstract. Pre-boot authentication software, in particular full hard disk encryption software, play a key role in preventing information theft[1]. In this paper, we present a new class of vulnerability affecting multiple high value pre-boot authentication software, including the latest Microsoft disk encryption technology : Microsoft Vista's Bitlocker, with TPM chip enabled. Because Pre-boot authentication software programmers commonly make wrong assumptions about the inner workings of the BIOS interruptions responsible for handling keyboard input, they typically[1] use the BIOS API without flushing or intializing the BIOS internal keyboard buffer. Therefore, any user input including plain text passwords remains in memory at a given physical location. In this article, we first present a detailed analysis of this new class of vulnerability and generic exploits for Windows and Unix platforms under x86 architectures. Un-

Annexe A : Non exhaustive list of software vulnerable to plain text password leakage

Vulnerable software :

BIOS passwords :

- Award BIOS Modular 4.50pg[33]

- Insyde BIOS V190[34]

- Intel Corp PE94510M.86A.0050.2007.0710.1559 (07/10/2007)

- Hewlett-Packard 68DTT Ver. F.0D (11/22/2005)

- Lenovo 7CETB5WW v2.05 (10/13/2006)

Full disk encryption with pre-boot authentication capabilities :

- Bitlocker with TPM and password based authentication enabled under Microsoft Vista Ultimate Edition
- Truecrypt 5.0 for Windows

- DiskCryptor 0.2.6 for Windows (latest)

- Secu Star DriveCrypt Plus Pack v3.9 (latest)

Computing

A Computer Infection that Can Never Be Cured

A hacker demonstrates that code can be hidden inside a new computer to put it forever under remote control, even after upgrades to the hard drive or operating system.

Malicious software, like all software, gets smarter all the time. In recent years it's learned to destroy physical infrastructure, install itself through Microsoft updates, and use human beings as physical "data mules," for instance. But researcher Jonathan Brossard has innovated a uniquely nasty coding trick: A strain of malware that's nearly impossible to disinfect.

At the Black Hat security conference in Las Vegas Thursday, Brossard plans to present a paper (PDF here) on "Rakshasa," a piece of proof-of-concept malware that aims to be a "permanent backdoor" in a PC, one that's very difficult to detect, and even harder to remove.

A sculpture of a Rakshasa, the Hindu demon from which Jonathan Brossard's malware experiment takes its name.

New SMB Relay Attack Steals User Credentials Over Internet

Researchers found a twist to an older vulnerability that lets them launch SMB relay attacks from the Internet.

BLACK HAT USA -- Las Vegas -- A Windows vulnerability in the SMB file-sharing protocol discovered 14 years ago and partially patched by Microso[ft] could still be abused via remote attacks, two security researchers demonstrated on stage at the Black Hat security conference on Wednesda[y].

Microsoft patched the vulnerability years ago, but it was actually a partial fi[x] because it based the patch on the fact that the attacker must already be on the local network, said Jonathan Brossard and Hormazd Billiamoria, two engineers from Salesforce.com. In their session, they demonstrated how th[e] SMB relay attack can be launched remotely from the Internet and seize control of the targeted system.

This is the first vulnerability ever reported to affect the Edge browser

As Mr. Brossard notes, all IE versions are vulnerable, including Microsoft's latest Edge browser, making this "the first attack against Windows 10 and its web browser Spartan."

Additionally, other vulnerable applications include Windows Media Player, Adobe Reader, Apple QuickTime, Excel 2010, Symantec's Norton Security Scan, AVG Free, BitDefender Free, Comodo Antivirus, IntelliJ IDEA, Box Sync, GitHub for Windows, TeamViewer, and many other more.

The research paper was written before the Windows 10 launch, and obviously before Spartan was renamed to Edge.

The research also includes different mitigation techniques, but according to Mr. Brossard, the most efficient one would be to set up custom PC-level Windows Firewall settings, preventing SMB data from leaking online via specific ports, where an SMB relay can be carried out.

Researchers show how to steal Windows Active Directory credentials from the … – Computerworld

Agenda

- WCC components
- "Libifying" a binary
- Unlinking binaries
- Crossing a Fish and a Rabbit
- Introduction to Witchcraft
- Binary "reflection" without a VM
- Towards binary self awareness
- Future work

WCC : components

WCC Components

Binaries (C):

wld : witchcraft linker
wcc : witchcraft core compiler
wsh : witchcraft shell : dynamic interpreter + scripting engine

Scripts (lua, ...):

wcch : witchcraft header generator
wldd : witchcraft compiler flags generator
...

Host machine : GNU/Linux x86_64 (mostly portable to POSIX systems).

Wld : "Libification"

Transforming an ELF executable binary into an ELF shared library.

DEMOS

Libification of proftpd

Libification of proftpd

We really patched 1 byte only

libification

```
typedef struct
{
  unsigned char e_ident[EI_NIDENT];     /* Magic number and
other info */
  Elf64_Half    e_type;                 /* Object file type */
  Elf64_Half    e_machine;              /* Architecture */
  Elf64_Word    e_version;              /* Object file version */
  Elf64_Addr    e_entry;                /* Entry point virtual address
*/
  Elf64_Off     e_phoff;                /* Program header table file
offset */
  Elf64_Off     e_shoff;                /* Section header table file
offset */
  Elf64_Word    e_flags;                /* Processor-specific flags */
  Elf64_Half    e_ehsize;               /* ELF header size in bytes */
  Elf64_Half    e_phentsize;            /* Program header table
```

Using our new shared library

```
jonathan@blackbox: ~/defcon2016/proftpd

        $(CC) $(CFLAGS) demo3.c -o demo3 $(LDFLAGS)

clean::
        rm demo1 demo2 demo3 ./*.c~
jonathan@blackbox:~/defcon2016/proftpd$ ccat demo1.c
/**
* Calling pr_version_get_str() from Proftpd.so
*
* endrazine for Defcon 24 // August 2016
*/
#include <stdio.h>
#include <dlfcn.h>

int main(void){
        char* (*getversion)() = NULL;
        void *handle;
        handle = dlopen("/tmp/proftpd.so", RTLD_LAZY);
        getversion = dlsym(handle, "pr_version_get_str");
        printf("Using proftpd.so version: \e[31m%s\e[0m\n", getversion());
        return 0;
}
jonathan@blackbox:~/defcon2016/proftpd$ ./demo1
Using proftpd.so version: 1.3.3d
jonathan@blackbox:~/defcon2016/proftpd$
```

How comes this works ?

We're really creating a "non relocatable" shared library.

ET_DYN and ET_EXEC ELF files are both executable (ASLR support in the kernel)

This is equivalent to creating a shared library with a non NULL base address (equivalent to prelinking)

Note: Amazingly, this shared library is still a valid executable too.

DEMOS

Linking against apache2

Apache2 as a shared library

```
jonathan@blackbox:~/defcon2016/apache$ ccat Makefile
CC       :=       gcc
CFLAGS   :=       -W -Wall
LDFLAGS  :=       /usr/sbin/apache2

all::
        $(CC) $(CFLAGS) ap2version.c -o ap2version $(LDFLAGS)
jonathan@blackbox:~/defcon2016/apache$ ccat ap2version.c
/**
* Calling ap_get_server_banner() from /usr/sbin/apache2
*
* endrazine for Defcon 24 // August 2016
*/
#include <stdio.h>

void *ap_get_server_banner();

int main (void){
        printf("Server banner: \e[31m%s\e[0m\n", ap_get_server_banner());
        return 0;
}
jonathan@blackbox:~/defcon2016/apache$ ./ap2version
Server banner: Apache/2.4.7
jonathan@blackbox:~/defcon2016/apache$ 
```

Apache2 as a shared library

```
jonathan@blackbox:~/defcon2016/apache$ ldd ./ap2version
        linux-vdso.so.1 =>  (0x00007ffea3a74000)

Wcc : "unlinking"

The typical approach to reverse engineering is to transform binaries or shared libraries back to source code.
Instead, we aim at transforming final binaries or shared libraries back to ELF relocatable objects, that can later be relinked normally (using gcc/ld) into executables or shared objects.
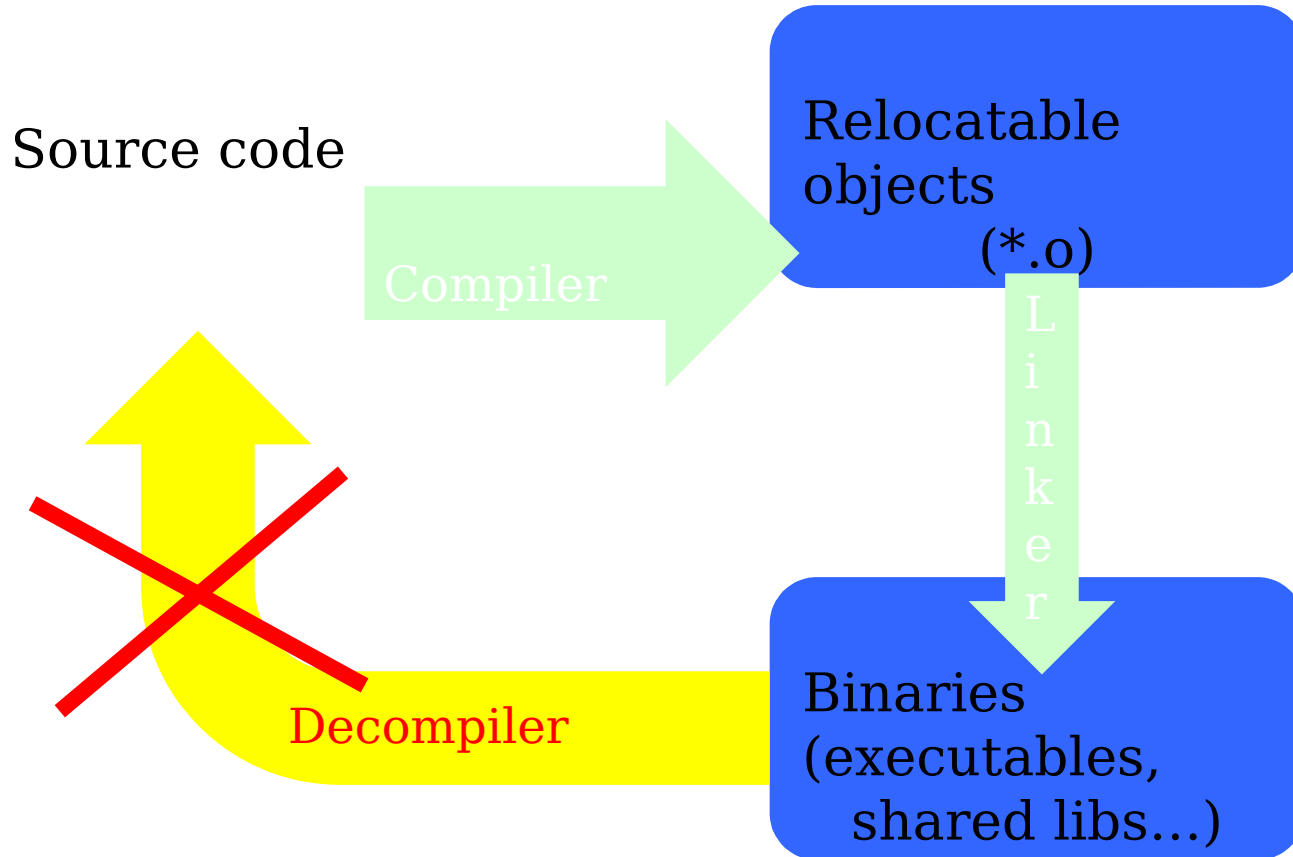

Source code

Compiler

Relocatable objects
(*.o)

Linker

wcc

Decompiler

Binaries
(executables,
shared libs...)

WCC : Command line

The command line is made to resemble the syntax of gcc :

The front end is build around libbfd. The backend is trivial C to copy each mapped section of the binary, handle symbols and relocations.

Benefit of using libbfd : the input binary doesn't need to be an ELF !

=> We can for instance transform a Win64 executable into ELF 64b relocatable objects...

Binary reflection

Binary "reflection" without a VM

Now that we know how to transform arbitrary binaries into shared libraries, we can load them into our address space via dlopen().
Let's implement the same features as traditional virtual machines, but for raw binaries !

Whish list :
- Load arbitrary applications into memory
- Execute arbitrary functions with any arguments (and get results)
- Monitor/Trace execution
- Automated functions prototyping/annotation
- Learn new behavior
- Examine/Modify arbitrary memory

WSH : architecture

Loading is done via dlopen().

The core engine/shell is built around lua.

Can be compiled with luajit to get JIT compilation.

Tracing/Memory analysis doesn't rely on ptrace() : we share the address space.

Lightweight : ~5k lines of C.

No disassembler (as of writing. Subject to change).

No need for /proc support !

Function names mapped in each library is dumped from the link_map cache.

Wsh : The wichcraft interpreter

Distinctive features:

- We fully share the address space with analyzed applications (no ptrace() nor context switches).
- Requires no privileges/capabilities (no root, no ptrace(), no CAP_PTRACE, no /proc…)
- No disassembly : fully portable (POSIX)
- Implements "reflection" for binaries
- Full featured programming language
- Interactive and/or fully scriptable, autonomous programs
- Has no types
- Has no fixed API : any function you load in memory becomes available in WSH
- Functions have no prototypes
- => Can call arbitrary functions without knowing their prototypes

Wsh : The wichcraft interpreter

Advanced features:

- Loads any code via dlopen() : this solves relocations, symbols resolution, dependencies for us.
- Secondary loader bfd based (could load invalid binaries, anything in memory).
- Dumping of dynamic linker cash internals (undocumented) : linkmap
- Breakpoints without int 0x03 (use SIGINVALID + invalid opcode)
- Bruteforcing of mapped memory pages via msync() (0day, no /proc needed)
- Wsh can be compiled to do JIT compilation on the fly at runtime.
- Automated fuzzing/extended prototyping/functional testing

NONE OF THIS IS SUPPOSED TO WORK

Witchcraft
FUTURE WORK

- Hyde our own presence better in memory (second heap)
- Remote debugging, running process injection
- Shadow mapping, internal libraries tracing (recursive ltrace)
- ltrace/strace to valid scripts
- system call tracing
